ABSTRACT

More than two-thirds of New Mexico's population live in places classified as urban by the Bureau of the Census. The state remained rural longer than did the United States as a whole, but by 1970 the proportion of the total population living in urban areas in New Mexico had increased to 69.8%, not much below the national percentage of 73.5. Urbanization in New Mexico was particularly rapid in the 1950's; the proportion of urban people in the total population increased 15.7%, nearly 3 times the rate of increase for the United States. In the 1960's, urbanization in the state took place at a much slower rate, only 3.9%. The urban-rural distribution of New Mexico's population in 1970 varied considerably from county to county. Nine counties had no urban population; in 6 counties, less than half of the population was urban; of the 17 counties with over half of the population urban, 10 had urban population percentages above the state average. In 1950, the Federal census for the first time showed a numerical as well as a percentage decline in the rural population. The numerical decline has continued since. The rural population loss, however, was not uniform throughout New Mexico. Twenty-three counties lost rural population in the 1960's, but the other 9 counties had increases, some of which were quite substantial. Approximately three-fifths of the population centers with 2,500 or more inhabitants lost population during the 1960's. (Author/JH)

NEW MEXICO'S URBAN AND RURAL POPULATION

AGRICULTURAL EXPERIMENT STATION RESEARCH REPORT 207

Summary

More than two-thirds of New Mexico's population live in places classified as urban by the Bureau of the Census. The state remained rural longer than did the United States as a whole, but by 1970, the proportion of the total population living in urban areas in New Mexico had increased to 69.8 percent, not much below the national percentage of 73.5 percent.

Urbanization in New Mexico was particularly rapid in the 1950s. During the decade, the proportion of urban people in the total population increased 15.7 percent, nearly three times as high a rate of increase as that for the United States. In the 1960s, urbanization in the state took place at a much slower rate, only 3.9 percent.

The urban-rural distribution of the population of New Mexico in 1970 varied considerably from county to county. Nine counties had no urban population in six counties, less than half of the population was urban; of the 17 counties with over half of the population urban, 10 had urban population percentages above the state average.

In 1950, the federal census for the first time showed a numerical as well as a percentage decline in the rural population. The numerical decline has continued since. The rural population loss, however, was not uniform throughout New

Mexico. Twenty-three counties lost rural population in the 1960s, but the other nine counties had increases, some of which were quite substantial.

Of the six planning and development districts in the state, two had small percentage declines in the urban population, but the other four showed high rates of increase. Rural population changes also varied as between planning and development districts. Losses occurred in four districts while two districts showed gains.

Approximately three-fifths of the population centers with 2,500 or more inhabitants lost population during the 1960s. Half of the centers with from 1,000 to 2,499 inhabitants lost population in the decade. Two-thirds of the centers with less than 1,000 inhabitants lost population.

Las Cruces, New Mexico

NEW MEXICO'S Urban and rural population

Sigurd Johansen Professor of Sociology

When power lines and improved roads began to reach rural areas, people said that the differences between city living and country living were being erased. But more and more people moved to the cities, and other differences arose. The implications of urbanization and depopulation of rural areas became evident.

Urbanization brings urbanism as a way of life for an increasing proportion of the population. It increases the political influence of urban centers. With urbanization come problems of housing, sanitation, transportation, law enforcement, and recreation.

On the other side of the coin, urbanization means that rurality as a way of life remains significant for relatively fewer people. It diminishes the political power of rural areas. Rural depopulation intensifies already existing problems with local government, law enforcement, health and medical services, rural education, economic services, and other institutional services.

New Mexico has no amulet that protects her from these problems of changing rural-urban population distribution. The particular set of problems in any area depends upon whether the population is increasing or decreasing and on whether it is urban or rural. This report presents data on various aspects of urban and rural population changes in New Mexico. It shows the relative proportion of urban and rural people in the state for each decade since 1850 and in each county in 1970. Special attention is given to urbanization since 1950. The report also shows the changes which have occurred between 1960 and 1970 in the urban and rural population in each county and in the six planning

and development districts in the state. Finally, it gives the population changes of the past decade for all incorporated places and all unincorporated places of 1,000 or more inhabitants.

The basic data included in the report are from publications of the Bureau of the Census.

Definition of Urban and Rural

According to the definition used by the Bureau of the Census for the 1970 census, the urban population comprises all persons living in urbanized areas and in places with 2,500 or more inhabitants outside urbanized areas. As defined, an urbanized area generally contains at least one city of 50,000 or more inhabitants and includes that portion of the surrounding territory, whether incorporated or unincorporated, which meets specified criteria relating to population density. The population not classified as urban constitutes the rural population.²

This definition of urban is essentially the same as that adopted by the Bureau of the Census for the first time in 1950 and also used in 1960. Therefore, urban and rural data are comparable for 1950, 1960, and 1970. Before 1950, the urban

¹The six districts (see table 6 and figure 2) were proposed by the State Planning Office and subsequently approved by the Governor of New Mexico. See "Planning and Development Districts for the State of New Mexico," *Planning Report No. 4*. State Planning Office, Santa Fe, 1969, P.2.

²Advance Report PC(VI)-33 Revised, Final Population Counts: New Mexico. U.S. Census of Population: 1970, p.2.

population was defined simply as those persons living in incorporated places of 2,500 or more inhabitants.

The Changing Urban-Rural Population Distribution in New Mexico

New Mexico definitely has become urban, in spite of its mountains and wide-open spaces (see table !). More than two-thirds of the population in 1970 was classified as urban by the federal census bureau. The urbanization, however, was slower in New Mexico than in the United States as a whole.

In 1920, the federal census for the first time showed over half the total population of the United States as urban. Since then, urbanization in the nation has continued at a rapid pace. According to the 1970 census, 73.5 percent of the total population is urban.

On the basis of the pre-1950 definition of urban, New Mexico was first classified as urban in the 1960 census. According to the definition of urban which was first used in the 1950 census, New Mexico just barely had become an urban state in 1950. By 1970, the proportion of the total population living in urban areas had increased to 69.8 percent.

The numbers of urban and rural people in New

Fig. 1. Urban and rural populations, New Mexico, 1850 to 1970

Mexico from 1850 to 1870 are shown graphically in figure 1.

The Urban and Rural Population in 1970

The 1970 urban-rural population distribution varies considerably by counties (table 2). Nine counties had no urban population. In six other counties, less than half of the population was

*Data for 1850-1960 are from Final Report PC (1)-33A, Number of Inhabitants: New Mexico, U.S. Census of Population: 1960, p. 5; data for 1970 are from Advance Report PC (VI)-33 Revised, Final Population Counts: New Mexico, U.S. Census of Population: 1970, p. 3.

**Data for 1860 are exclusive of the population of the area taken to form a part of Colorado Territory in 1861 and of the population of the area organized as a part of the Territory of Arizona in 1863. No estimate of the population in 1850 is available for the territory acquired from Mexico through the Gadsden Purchase (1853) and annexed to New Mexico in 1854.

***Current urban definition.

****Includes the population of a delineated urbanized area in Bernalillo County outside the city of Albuquerque. The population of that area was 40,027 in 1960 and 18,323 in 1970. There was no urbanized area delineated for Albuquerque for the 1950 Census.

^{*}Advance Report PC(VI)-33 Revised, Final Population Counts: New Mexico, U.S. Cénsus of Population: 1970, p. 3

urban, the lowest proportion being 15.5 percent in Rio Arriba County. In the 17 counties with over half of the population urban, 10 had percentages above the state average of 69.8 percent, Los Alamos having the highest, 99.8 percent.

However, percentages are sometimes misleading. A county with a relatively high percentage of urban people in its total population may contribute relatively little to the urban population of the state because the total county population is small. For example, Hidalgo County was 72.4 percent urban in 1970 but had only 3,429 urban inhabitants. On the other hand, Eddy County was 76.9 percent urban, approximately the same percentage as Hidalgo County, but it had 31,612 urban inhabitants.

A better picture of the importance of the urban population in the counties relative to the total urban population in New Mexico will be obtained by looking at what percentage of the total urban population in the state is located in a given county (see table 3).

Of the 23 counties with urban populations in 1970, the percentage which each had of the state's urban population varied from 42.0 percent in Bernalillo County to 0.4 percent in Union County. Four counties (Dona Ana, Lea, Santa Fe and Bernalillo) accounted for 60.1 percent of the urban population in the state. On the other hand, five counties (Hidalgo, Rio Arriba, Sierra, Socorro, and Union) had only 2.7 percent of the state's urban population.

The importance of the rural population in each county relative to New Mexico's total rural population can be seen in table 4.

As with the urban population, although not as much, the rural population is concentrated in certain counties in the state. The 10 counties with

^{*}Less than one-tenth percent

over 10,000 rural population account for almost two-thirds of the rural population. In comparison, the seven counties each having less than one percent of the state's rural population collectively had 3.8 percent of that population.

The urban-rural distribution in 1970 in the six planning and development districts is shown in figure 2.

Urbanization During the 1950s

Table 1 shows the extensive urbanization in New Mexico during the 1950s. The increase in the proportion of urban people from 50.2 percent in 1950 to 65.9 percent in 1960 was phenomenal. It was an increase of 15.7 percent; the increase for the United States as a whole was only 5.9 percent. Numerically, the increase amounted to 284,590

4

persons. Over one-third of the increase occurred in Albuquerque, but the increases were also general throughout the state.

Since the definition of urban used by the Bureau of the Census was the same for both 1950 and 1960, the explanation for the relatively large urban increase during the 1950s must lie elsewhere.

Most of the urban population growth occurred in places that were classified as urban in 1950. The majority of these were incorporated places with 2,500 or more inhabitants. The increase in these centers during the 1950s accounted for 77.9 percent of the urban increase ir. the state. However, this increase was partly due to changes in the corporate limits of the centers. Numerically, the population in the centers increased by 221,723 persons (including 104.374 in Albuquerque), but only 58.9 percent of that increase occurred within the corporate limits as they existed in 1950. The remaining 41.1 percent was in areas annexed to the centers between 1950 and 1960.3

The remainder of the urban population growth during the 1950s (22.1 percent) was due to the following factors: 1) the delineation of an urbanized area in Bernalillo County around the city of Albuquerque (exclusive of Armijo, Atrisco-Five Points, and Los Duranes, which became a part of the city in the 1950s); 2) the increase in two unincorporated centers (Los Alamos and Zuni Pueblo) and the addition of one unincorporated center (State College-Mesilla Park), all with more than 2,500 inhabitants; and 3) the inclusion of seven incorporated places which were classified as urban in the 1960 census but not in the 1950 census (Aztec, Bernalillo, Eunice, Grants, Jal, Milan, and Tularosa).⁴

Urban Population Changes in the 1960s

New Mexico's urban population grew rapidly during the 1950s but not during the 1960s. Between 1960 and 1970, the proportion of urban inhabitants in the total population increased by only 3.9 percent, about the same as the national average of 3.6 percent. In the 1960s, the extension of the corporate limits of places with 2,500 or more inhabitants contributed much less to the urban population than in the 1950s. Annexation in the 1960s added only 32,010 persons to the urban population, compared with an increase of 91,088 due to annexation in the 1950s. In many of the

³Final Report PC(1)-33A, Number of Inhabitants: New Mexico, U.S. Census of Population: 1960, p. 10.

centers, the increase in numbers due to annexation did not compensate for losses within the corporate limits as they existed in 1960.

Furthermore, urban population increases were much less general over the state than they had been in the previous decade. In 10 of the 22 counties with urban population in 1960, decreases occurred during the decade. The increase in five counties—Bernalillo, Curry, Dona Ana, Otero, and Santa Fe—was substantial enough to far exceed the urban population increase for the entire state (see table 5).

Figure 3 shows the New Mexico counties with urban population in 1970 ranked according to the percentage change between 1960 and 1970.

Urban population changes between 1960 and 1970 are shown in table 6 for the six planning and development districts in the state. Two districts lost urban population during the decade, but on a percentage basis the loss was not large. It was approximately the same in both districts. In the other four districts, the urban population increased and the rates of increase were large, especially in District 5, where it was 28.9 percent—more than

twice the 13.1 percent increase in the urban population in New Mexico between 1960 and 1970.

Rural Population Changes in the 1960s

As the percentage of urban people in the total population of New Mexico has increased, the percentage of rural inhabitants has decreased. Despite its longtime proportional decline, the rural population increased numerically until the 1940s (table 1). In 1950, for the first time, the census showed a numerical as well as a percentage decline

*1960 raw data are from PC(1)-33A, Number of Inhabitants: New Mexico, U.S. Census of Population: 1960, p. 8; raw data for 1970 are from Advance Report PC(V1)-33 Revised, Final Population Counts: New Mexico, U.S. Census of Population: 1970, p. 3.

Just as the urban population changes varied from county to county, the rural population changes differed greatly among counties (table 7). Eleven counties had less than 10,000 inhabitants in 1970. All but two of these showed substantial rural population losses between 1960 and 1970. Losses like these assume significance since the county populations already were small. The rural exodus has so reduced the size of the population that not enough people are left to maintain basic services and institutions. The people who remain in such areas frequently live in a chronically depressed condition.

Rural population in the state as a whole declined 5.3 percent. Twenty-three counties had declines

ranging from 2.4 percent in Lincoln County to 47.8 percent in Chavez County. (Los Alamos had a decline of 94.0 percent but only 453 persons were classified as rural in that county in 1960.)

Of the nine counties with increases in rural population, three-McKinley, Sandoval, and Valencia-each had numerical increases which exceeded 5,000 persons. On a percentage basis, the biggest increase (50.4 percent) occurred in Sandoval County.

The rank order of the counties in terms of the percentage gain or loss of rural population between 1960 and 1970 is shown in figure 4. The change in Los Alamos is not shown because of the small rural population in the county.

Rural population changes also varied as between the six planning and development districts in the state (table 8).

Losses occurred in four districts while two districts showed gains. There was some slight variation within some of the districts, but on the whole each district either showed a uniform loss or gain in the rural population.

New Mexico's Population Centers

Included in this report, for purposes of general information, are data on the 1960 and 1970 population of "places" in New Mexico.⁶ For the sake of convenience, the centers have been put into the following categories: 1) incorporated and unincorporated places of 2,500 or more inhabitants; 2) incorporated and unincorporated places of 1,000 to 2,499 inhabitants; and 3) incorporated places of less than 1,000 inhabitants.⁷ Data for the three categories are shown in tables 9, 10, and 11, respectively.

Of the 34 places with more than 2,500 inhabitants, 20 lost population between 1960 and 1970. Of the larger cities in the state, Albuquerque, Las Cruces, and Santa Fe. however, gained large percentage increases.

The 1970 census included seven unincorporated places for which no population was separately enumerated in 1960 (table 9). The population of three of these is included in the urbanized area in Bernalillo County. Without the designation of the other four as urban, the percentage increase in the urban population in New Mexico would have been even smaller than the 3.9 percent increase reported.

Table 10 indicates that of the 14 places in New Mexico with from 1,000 to 2,499 inhabitants for which the population was enumerated in 1960, exactly half lost population in the 1960s.

It is evident that the population centers in New Mexico with less than 1,000 inhabitants are losing population (table 11). Of the 39 such centers for which the population was enumerated in 1960, over two-thirds lost population between 1960 and 1970.

⁶The term "place" as used in the reports of the Bureau of the Census refers to a concentration of population regardless of the existence of legally prescribed limits, powers, or functions.

⁷Census reports do not show population data for any unincorporated places of less than 1,000 inhabitants.
